A Brief Report on Revival of Compost Pit in college**

Nature recycles by breaking down organic material and re-using it. Composting is the accelerated form of this decomposition process. In order for nature to decompose, microorganisms eat and inhabit decaying matter to break these materials down even further. Compost happens when materials are gathered in a bin or pile, moistened, and aerated. Fungi, bacteria, and invertebrates are able to take over and composting happens. In the end, the finished product is humus, dark brown organic matter which builds up soil, saves space in the landfill, and teaches schoolchildren how nature recycles. In this regards, students of NSS revived the compost pit of the college on 25th July, 2018. More than 25 students participate in his event.
